

Homework Questions

$$\textcircled{17} f(x) = -x^2 - 1$$

-2	$-(-2)^2 - 1$	-5
-1	$-(-1)^2 - 1$	-2
0		-1
1		-2
2		-5

Homework Quiz

Make a table and graph the following function.

$$y = -2x^2 + 4$$

You have graphed the functions:

$$y = ax^2 \quad y = ax^2 + c$$

a : vertical stretch $a > 1$
horizontal stretch $0 < a < 1$
 c : $\uparrow \downarrow$

How would we graph the function: $y = ax^2 + bx + c$

The b value is going to effect the axis of symmetry.

$$y = \frac{1}{2}x^2 + 1$$

"is there a b value?"

Axis of Symmetry:

$$x = 0$$

The equation for the axis of symmetry

$$AOS = -\frac{b}{2a}$$

Graph the function: $y = x^2 + 6x + 9$
 $ax^2 + bx + c$

Step 1: Find the equation of the axis of symmetry.

$$b = 6, a = 1 \quad AOS = -\frac{b}{2a}$$

$$AOS = -\frac{6}{2(1)}$$

$$AOS = -\frac{6}{2}$$

$$AOS = -3$$

$$x = -3$$

Graph the function: $y = x^2 + 6x + 9$

Step 2: Find the vertex by plugging in the AOS.

$$y = (-3)^2 + 6(-3) + 9$$

$$y = 9 - 18 + 9$$

$$y = 0$$

vertex: $(-3, 0)$

Graph the function: $y = x^2 + 6x + 9$

Step 3: Find two other points on the graph.

The first should be the y-intercept

The y-intercept is when $x = \underline{0}$

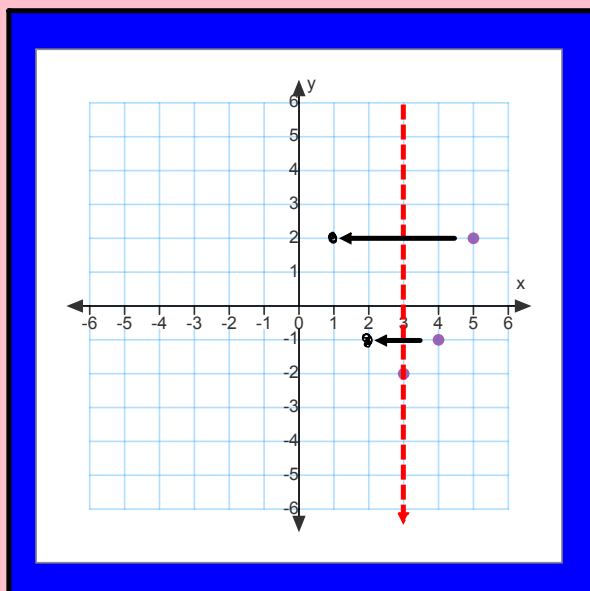

$$y = (0)^2 + 6(0) + 9$$

$$y = 0 + 9$$

$$y = 9$$

(0, 9)

The last point you will find will be a reflection over the axis of symmetry

$(-6, 9)$
